Russian Federation

Water vapor radiometer (WVR) is used for:

- ~ real-time zenith TWD monitoring,
- I WV / PWV monitoring

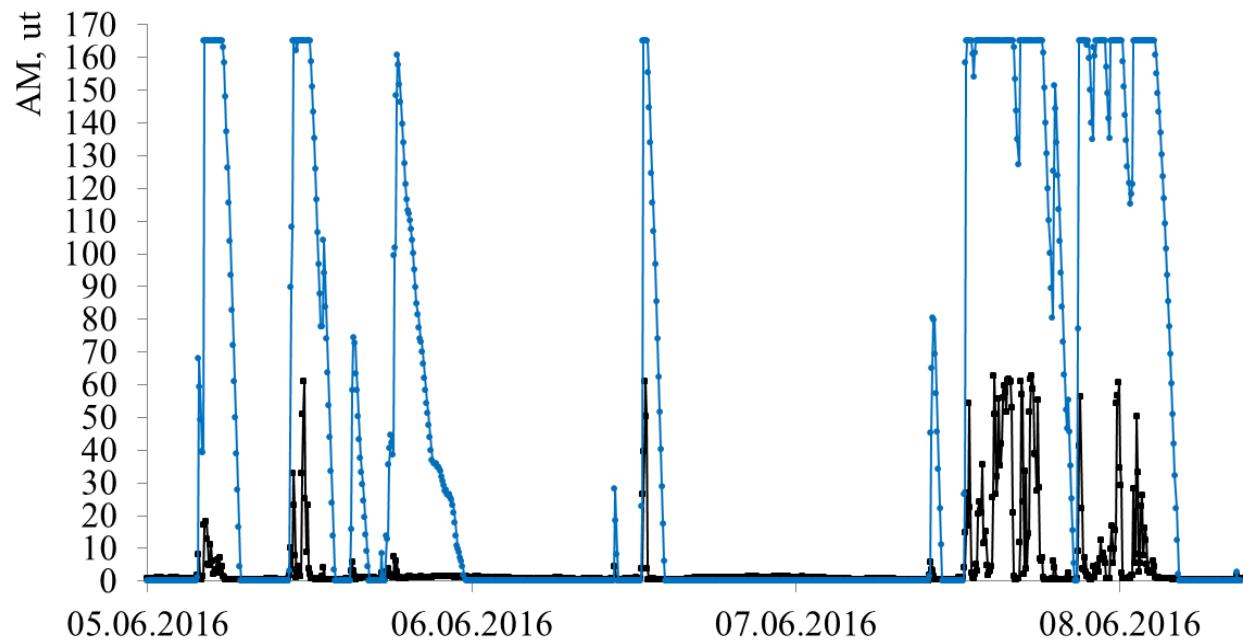

Total time interval: 81h

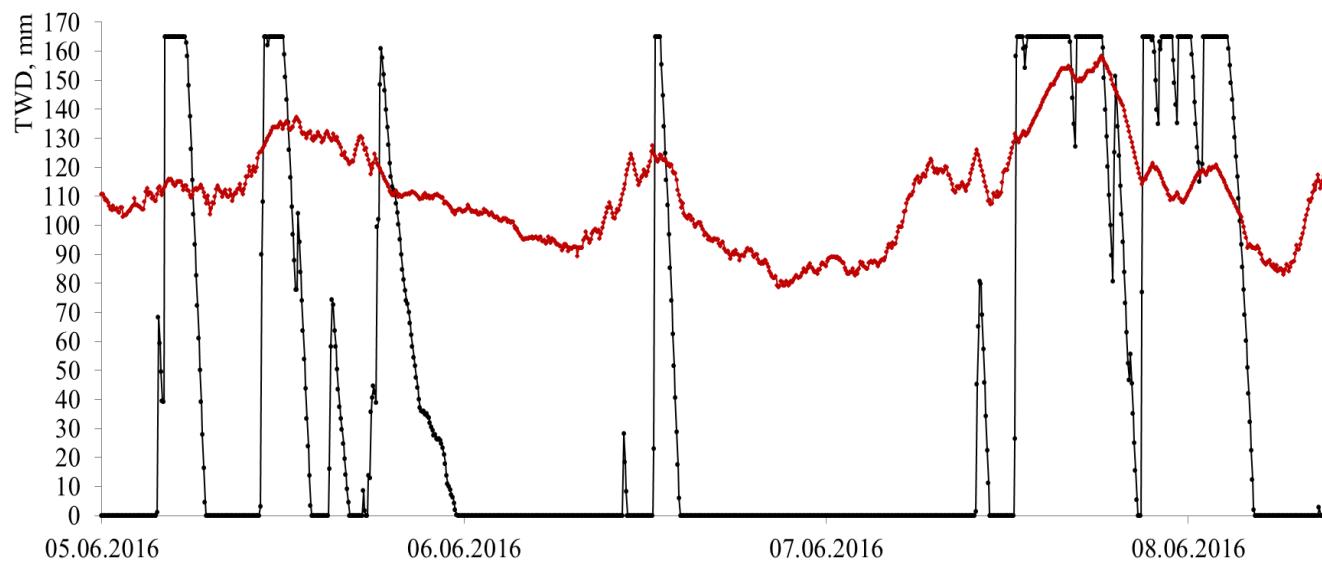

Damaged by rain: 11,25 h

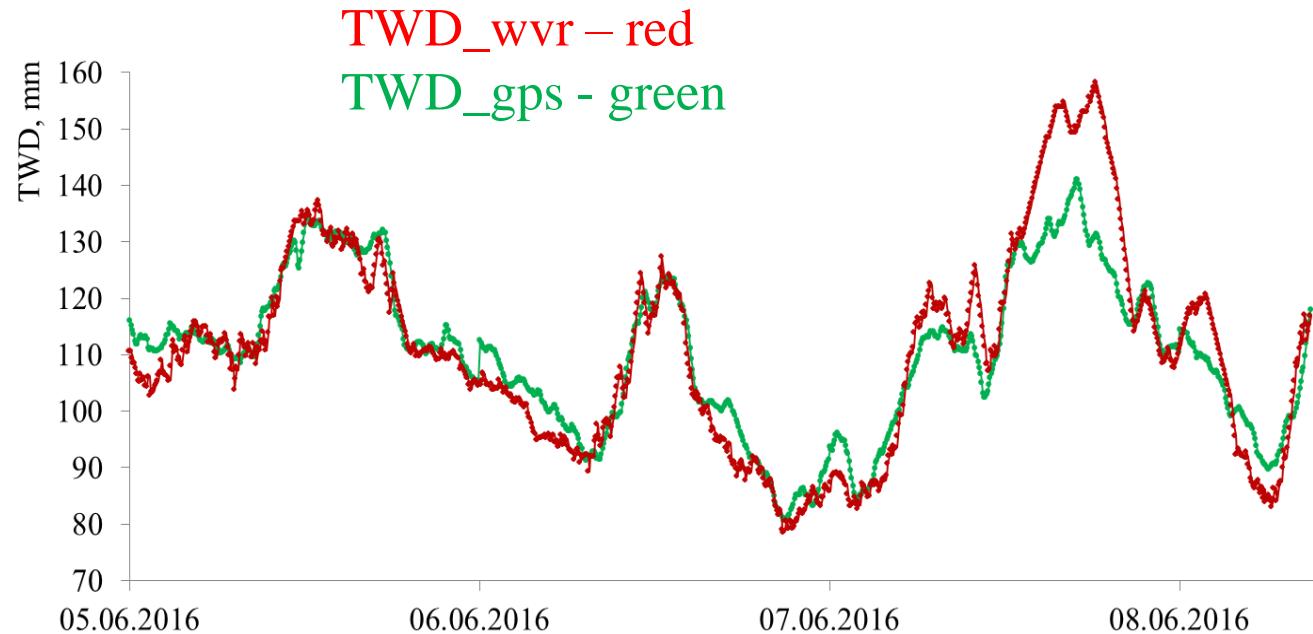

How to minimize the false data volume?

Empirical algorithm for correction of TWD's values
in rain condition was developed

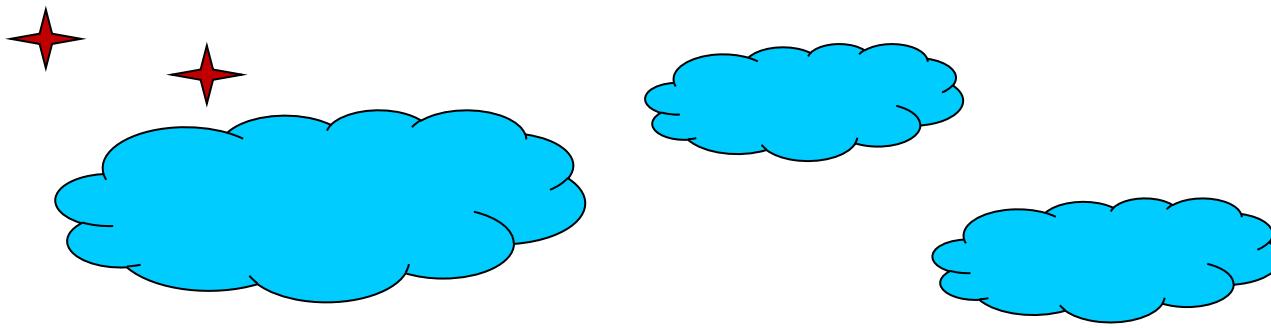

«Accumulated moisture» parameter is in relative units. Rain sensor signal (black).

If $|TWD_{WVR} - TWD_{IGS}| \geq 10 \text{ mm}$, false data

11,3 h \longrightarrow 1,4 h

Thank you for your attention!
